

Command Center Narrative

For Jonna Andersson it has been a pretty chaotic past 3 months; it's the end of the very first sales cycle for Palette Pharma's oncology drug, Lindahl. Jonna is on the commercial excellence team and reports directly to the Franchise VP, Jill Roord. Largely because this is the first product launch orchestrated with Aktana, but Jill has taken a very hands-on approach by making sure the commercial team is in lock-step with the sales team.

OmniChannel

Our Franchise VP Jill, has directed her team to translate the Q2 brand strategy into a series of specific campaigns and tactics for each segment; balancing the needs across all the brands in the franchise. The status reports on the individual campaigns show promise and have been helpful, but Jill is struggling to see what she might be missing from an overall strategy point of view. Although still early in the launch, she wants to see whether her team's execution is meeting 3 strategic goals:

1. First, is a product goal to focus at least 50% of promotional efforts on the newly launched Lindahl.
2. Second, is a channel utilization goal to use digital channels as the primary means of communication, and only using the field teams for Tier 1 and 2 HCPs who have no digital access. *(for customers with multiple brands this can be mentioned as a portfolio goal)*
3. And third is a communication and content goal ensuring that the latest clinical trial data gets shared with all target HCPs within 60 days of release.

To check progress Jill logs into the Aktana control center where she is presented with the executive view. This shows her the execution in terms of product, channel, and content type for each segment. Here she begins to understand what is happening across brand and commercial

engagement. The first thing she sees is a chart showing total HCP touchpoints per product, as well as the last three months' performance and the strategic goal. It immediately jumps out that Lindahl is not receiving as much attention as expected. When Jill hovers on the chart she is shown only 30% of total activity, instead of the goal of 50%, and that the main limitation to getting more engagement is not having enough content in the preferred channel. Further, it is revealed that 60% of Lindahl targets prefer digital engagement, but only 15% of the needed content is available in digital format. With the issue diagnosed, Jill believes that with a simple adjustment she can fine tune the engagement strategy. Now in the Optimizer, she decreases the channel priority influence and increases the product priority influence. This will place a greater importance on the preferred product, Lindahl, and give the system more flexibility in which channel is preferred. To confirm this hunch, Jill simulates this adjustment, and the results support her intuition as they predict 53% of touchpoints to be Lindahl-focused going forward. She then quickly takes a note to direct her team to create more digital content for Lindahl going forward.

Now in the Lindahl dashboard, Jill navigates to the Content view. Here, she again sees a gap in execution. The clinical trial data goal is only 65% complete. A notification calls out that there is a lack of digital content. Jill is a little suspicious and is certain there has been sufficient content created for all channels, including marketing emails, around clinical trial data.

On the content tagging page she sees that the A.I. identified content tagging has captured most, but not all, of the new clinical trial data content. One key email template was mis-tagged by the A.I. as a newsletter, since it talks about a "monthly update". Jill quickly drags and drops the clinical trial tag onto the template to rectify the situation.

Segmentation

Working closely with Jill, Jonna is curious how over the past 3 months the inherited segmentation has been performing, what they can learn about the strategy from the first sales cycle, and how they might be able to refine or even micro-segment via some key variables.

For launch, the decision was made to keep the segmentation unchanged, but now it's time to see the report of those segments.

Aktana has provided Jonna with a new workflow tool, which she is pleased with overall, but she is still exploring all of its capabilities. At the dashboard level, an overall health check of the brand strategy is presented. Here, at a quick glance, Jonna digests the overall performance for strategic campaigns, the engagement rates for content and channels, as well as the metrics for the customer journey segments.

The 5 primary segments are clearly visible along with their general makeup; a high-level description, the total size of targets, etc. Accompanying this makeup is some output numbers on engagement as well as a notification that the A.I. model powered by Aktana is indicating a possible micro-segmentation in the *trialist* segment. Jonna clicks in and in doing so she is presented with a full-screen layout of all the information that comprises this segment; more detailed specs than what was shown on the dashboard, the ability to edit the content are also here (name, description, etc.), and even real-time performance metrics. Below that is a trends section; clinical trials, patient training, dosing, account opening, new patient counts, (*PMS enrolment - JPN only*) and access support are all shown in individual trend graphs. Although, what really has her attention is the A.I. influence and its recommendations.

Here she sees that a subset that has an above-average gap in their ordering behavior according to Sales Change Detection. Aktana suggests this subset become a micro-segment so that it can be targeted differently than the whole of the *trialist* segment. Jonna brings Jill over to confer, they discuss which key message is recommended, and based on some known values they agree to add some more visual content around patient adherence. With a push of a button, the micro-segment is created. Jill continues with building out the agreed-upon key message content to address this new micro-segment, and soon, not only will the new segment be ready for global use but the *Map Trialist SCD segment to the Key Message* content is also pushed into the omnichannel automation system and now can be used by the whole of the brand team.

HCP Journey

During this time Christos Fabinho, another member of the Palette Pharma commercial team, is currently reviewing the campaign journey flow for the Lindahl strategy. His focus is on the business objective defined as “discovery” which applies to the *awareness* segment. This is defined as a target of HCP, potential HCP, or a facility sales situation that has zero sales.

To move to the next segment group, *Interest*, key metrics such as traditional sales indicators and digital engagement markers are tracked. Non-traditional metrics are used as well such as field force sentiment market research and A.I. social listening evidence. All of these comprise this stage of the journey and from what Christos sees progression so far has gone well. They converting slightly above the ##% defined as a launch goal for the first quarter. Despite this Christos sees there is a bottleneck within the flow, which could be preventing them from converting even more into the *Interest* segment.

It seems that HCPs who did not attend a specific event, a key activity for the Awareness segment, are not progressing to the next phase (INTEREST) as well as those who attended the event. Christos reaches out to a colleague, Carla, to see if there might be a recorded webinar as content, because he would like to add a step in this journey with that recorded event to address this bottleneck in the flow. Carla confirms and *NAME WEBINAR RECORDING CONTENT* is added to the awareness journey flow.

One Team

Meanwhile out in the field, Allison Becker, a President’s Club member, has been with Palette Pharma for a little over two years, but has been in the industry for 8. It’s 0630 on the west coast and Allison is in the midst of her pre-call planning; three in-person details today, two are T1’s and a T2.

However, as soon as she opens her tablet, she can already tell that her day isn’t happening as planned. Her first target, Dr. Dee, has a new published Insight. As she reads the summary card it

appears that Dr. Dee has just moved out of the *Trialist* segment and into the *Prescriber* segment. Upon clicking in to read further, some positive activity occurred overnight. Dr. Dee registered for the upcoming Lindahl webinar and posted a tweet about the event to her network. Because of this recent activity the suggestion for Allison to follow up with Dr. Dee today regarding registering has now been marked completed. And through social listening, her post about the event advanced him in the journey flow.

With Dr. Dee no longer a part of today's plan, Allison turns her attention to Dr. Alfie Wood, who has a new Aktana Suggestion this morning. Although the original plan was to visit Dr. Wood today without an appointment, Aktana is recommending a virtual detail because Dr. Wood appears to have a preference for remote calls, and if done today at 13:30 there is a 78% probability score. Allison doesn't oppose and triggers the MA to set up the secure remote call.

It's not even 0700 and Allison is pretty pleased with her schedule so far. Mostly because her T3 target, Dr. Maria Paula Monterero, has been underserved for weeks. But now she can prioritize her face to face. Allison pulls up Dr. Monterero's advanced insights page where she reviews the doctor's latest brand touchpoints and message preferences. Mentally she plans out her strategy with the intelligence provided and is feeling pretty confident.

The rest of Allison's day will be filled with a plethora of RTEs; however, now that she won't be on the road so much, she decides to put down her tablet, and take the extra time this morning to walk her son to school.
